

Lightning 4

10 Channel, 16 Bit, 160MHz Analog-to-Digital Converter

Model Number: 3DR-V6-ADC-160MSPS

3D COMPUTING OVERVIEW

3DR Computing technology brings together high performance computing, ease of programmability, low-cost, and commercial I/O flexibility in a modular, open systems and standards architecture to realize uniquely scalable and widely configurable, high speed embedded processing solutions for the development of radar, EW, SIGINT, and communication systems.

3DR Computing possesses the unique ability to morph in size, shape, and processing capacity. This flexibility provides a low cost, standard solution capable of rapidly conforming to the vastly different power, space, and environmental requirements found aboard any surface, sub-surface, or airborne system or platform.

FEATURES

FPGA

- Xilinx Virtex 6 (XC6VLX240T)
- LX365T & LX550T available in 1759 package
- DDR memory module
- Up to two FPGA configurations
- JTAG Programmable
- 2 NOR flash configuration/user
- Programmable memories (master BPI configuration, write protect available)

Analog-to-Digital Conversion

- 10 channel
- 16 bit
- 160MSPS
- SNR 78dB
- SFDR 95dB

I/O Support Available Via

- Y-connector (2x)
- Z-connector (2x)
- JTAG
- DB29 connections
- 14 Gbps in Z

Clocking and Triggering Flexibility

- Sample gates (SMA)
- Trigger (SMA)
- Clock inputs (SMA/TwinAx)

DDR2

- Up to 3GB

Clocking Options

- Onboard oscillator
- Offboard SMA
- Offboard TwinAx
- Board-to-Board Y connector
- Board-to-Board Z connector

PRODUCT DESCRIPTION

The 3DR-V6-ADC-160MSPS, known as Lightning IV, is a 10 channel, 16 bit, 160MHz Analog-to-Digital converter board for digitizing and processing analog inputs. High performance, low latency processing can be implemented via the onboard VIRTEX-6 FPGA (XC6VLX240T). As with all 3DR computing modules, Lightning IV supports three dimensional connectivity, allowing the user to stack and/or tile modules to address a wide variety of processing, I/O, size, weight, and power requirements.

Lightning IV provides PCIe and LVDS interfaces via the Y and Z connectors to other modules in the 3DR computing family. It also offers additional external interfaces including TwinAx, and SMA connections for clocking and triggering flexibility. Lightning IV standard microcontroller architecture is interfaced through the I2C bus to provide FPGA temperature, voltage, and current monitoring for automatic shut-down during critical over heat and/or voltage conditions.

BENEFITS

- Enough FPGA flash memory to hold two FPGA configurations
- On board circuitry fuse and temperature monitoring for board protection
- Standard 4-pin power connector

APPLICATIONS

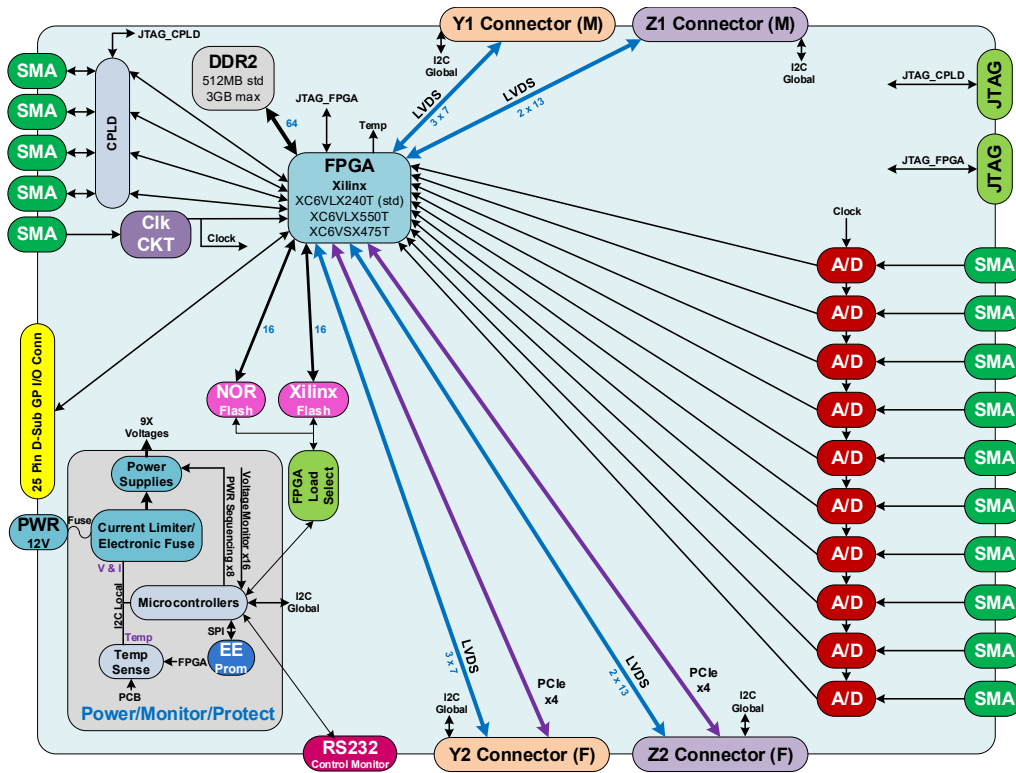

- Digital signal processing/data acquisition
- Radar receiver (digital receiver)
- Digital array processing & beamforming
- Electronic warfare/attack systems
- Digital image processing
- Remote sensing

SBIR DATA RIGHTS: Contract#: HQ0006-08-C-7908 Contractor Name: Colorado Engineering, Inc. Contractor Address: 1915 Jamboree Dr., Colorado Springs, CO 80920 Expiration of SBIR Data Rights: Expires 5 years after completion of project work for this or any follow-on SBIR contract, whichever is later. The Government's rights to use, modify, reproduce, release, perform, display, or disclose technical data or computer software marked with this legend are restricted during the period shown as provided in paragraph (b)(4) of the Rights in Noncommercial Technical Data and Computer Software--Small Business Innovative Research (SBIR) Program clause contained in the above identified contract. No restrictions apply after the expiration date shown above. Any reproduction of technical data, computer software, or portions thereof marked with this legend must also reproduce the markings.

ITAR Notice: Exports of information/data contained herein may be subject to the export laws of the United States including, but not limited to, the US International Traffic in Arms Regulations (ITAR), and may require advance authorization from the U.S. Government. The parties shall not export, disclose or transfer any such data directly or indirectly without compliance with this or any other applicable laws and regulations. This material provides up-to-date general information on product performance and use. It is not contractual in nature, nor does it provide warranty of any kind. BLOCK DIAGRAM

CONFIGURATIONS

Model Number	Configuration
3DR-V6-ADC-160MSPS-C	Commercial temp 0°C-50°C

*Please contact CEI for extended temperature range options

SPECIFICATIONS

Microcontroller Interface

- Dual microcontrollers programmable over SPI bus
- Controls power-on and power-down sequencing
- Monitors voltages and reports faults over I2C bus
- Monitors current, e-fuse shut-down, and reports over I2C bus
- Monitors board/chip temperature over I2C bus (external user defined sensor available)
- On board EEPROM for data storage and logging (write protect available)
- FPGAs and CPLDs programmable over JTAG Bus (for applicable modules with FPGAs and CPLDs)

Externalities

- Y1, Z1 connectors : LVDS (FPGA)
- Y2, Z2 connectors: PCIe & LVDS (FPGA)
- A/D channels: up to ten 25 pin d-sub general Purpose I/O
- A/D**
- Texas Instruments ADC 6DV160 (2 channels / device)
- 16 bit, 160MHz, 160 MSPS
- Up to 10 channels
- DDR LVDS output
- +/- 1.1v PP Input, 50 Ohm input impedance

Physical

- Dimensions: 6.25”L x 6.25”W (including connectors: 6.668”L x 6.289”W)
- Distance Between Boards (Stacked; Board-to-Board) : 1.1”
- Weight: ~13oz.
- Environmental**
- Operating temperature: 0 - 50 °C (commercial configuration)
- Storage temperature : (est) -55°C to 100° C, cooling airflow recommended, FPGA application dependent (heat sink mounts available)
- Power**
- Power consumption (based on FPGA loading) 12V @2.0 Amps
